Kinect Reconstruction

Objective

We are going to integrate RGB data and depth data from 2 Kinect V1 devices to reconstruct a scene.

You will be given a series of color and depth image pairs and you will reconstruct a scene using a point cloud.

A point cloud is a way to represent the external surface of an object

Step by Step

- Step 1: Image Acquisition
- Step 2: Camera Calibration
- Step 3: 3D-Reconstruction

Step 1: Image Acquisition

Obtain a set of image RGB and depth pairs from the Kinect stereo system

Checkerboard Calibration Technique

Step 2: Calibration

- **Detect the corner points of the checkerboard**
- Calibrate each camera separately (to get intrinsic parameters)
- Calibrate one camera with respect of each other (to get extrinsic parameters)
- Calibrate RGB data with respect of Depth data of Kinect

Step 2: Calibration

- Detect the corner points of the checkerboard
- **Calibrate each camera separately (to get intrinsic parameters)**
- Calibrate one camera with respect of each other (to get extrinsic parameters)
- Calibrate RGB data with respect of Depth data of Kinect

Step 2: Calibration

- Detect the corner points of the checkerboard
- Calibrate each camera separately (to get intrinsic parameters)
- **Calibrate one camera with respect of each other (to get extrinsic parameters)**
- Calibrate RGB data with respect of Depth data of Kinect

Step 2: Calibration

- Detect the corner points of the checkerboard
- Calibrate each camera separately (to get intrinsic parameters)
- Calibrate one camera with respect of each other (to get extrinsic parameters)
- **Calibrate RGB data with respect of Depth data of Kinect**

Step 3: 3D Reconstruction

Project All the information w.r.t to the left camera

Use the information from both depth and color cameras to create a point-cloud version of the captured scene
